CT CHEST, ABDOMEN AND PELVIS WITH CONTRAST

Patient: Dana EXAMPLE **DOB:** 14/05/1962
MRN: SO-100451 **Accession:** HX-26-55120

Date of examination: 02/10/2026 · **Referrer:** Dr Alex Rivera (synthetic)

Clinical details: Metastatic EGFR-mutant lung adenocarcinoma on docetaxel. Restaging.

Comparison: CT 03/07/2026 and 02/04/2026.

Findings

Right upper lobe primary mass measures 25 x 21 mm (previously 24 x 21 mm), stable.

Extensive right pleural thickening and nodularity, unchanged. Loculated right pleural effusion, maximal depth 61 mm (previously 52 mm), mildly increased.

Right lateral chest wall soft tissue nodule at the level of the 6th rib measures 17 mm (previously 13 mm in July and 9 mm in April), progressively enlarging.

Sclerotic lesions in the right 6th rib and T12 vertebral body are unchanged.

No new pulmonary nodules. No interstitial lung disease. Liver, adrenals and abdominal nodes normal. No ascites.

Impression

1. Mixed response: stable primary; progressive right chest wall nodule (17 mm, from 13 mm) and mildly increased loculated right pleural effusion. Overall appearances in keeping with progressive disease.
2. Stable sclerotic bone lesions (right 6th rib, T12).
