Dr Sam Example (synthetic)
Parramatta Example Medical Centre

Dear Sam,

Re: Jordan PLACEHOLDER, DOB 30/08/1979

Diagnosis: Stage IVA (cT2bN2M1a) ALK-rearranged (EML4-ALK variant 3) adenocarcinoma of the right lower lobe, with a contralateral left lower lobe metastasis. PD-L1 TPS 60%. MRI brain 23/09/2026: no intracranial metastases.

Thank you for referring Jordan. He remains fully active and working, with a mild cough only. **ECOG performance status 1.** Examination was unremarkable.

Bloods show mildly raised ALT (61) and AST (38), likely related to moderate alcohol intake or fatty liver; bilirubin is normal. Renal function is normal.

No treatment has yet been given for his lung cancer.

Plan:
1. First-line ALK inhibitor: alectinib 600 mg twice daily (PBS) or lorlatinib, discussed today; Jordan would like to consider clinical trials first.
2. Screen for first-line ALK-positive NSCLC trials before starting treatment, within the next 2 weeks.
3. Repeat LFTs in 1 week.
4. Review 3 October 2026.

Kind regards,

Dr Alex Rivera (synthetic)
