Dr Morgan Grey (synthetic)
Example Family Practice

Dear Morgan,

Re: Casey FICTIONAL, DOB 03/02/1951, 18 Example Cres, Wollongong NSW 2500

Diagnosis: Stage IVB KRAS G12C-mutant adenocarcinoma of the left upper lobe (diagnosed October 2025), with adrenal and bone metastases. STK11 co-mutation. PD-L1 TPS 30%.

Other history:
- Melanoma, left upper back, stage IB (pT2a pN0), wide excision and sentinel node biopsy April 2023. Under dermatology surveillance, no recurrence.
- Chronic kidney disease stage 3a (eGFR 45–55).
- Type 2 diabetes mellitus.
- COPD (ex-smoker, 40 pack-years, quit 2015).

Treatment to date:
1. Carboplatin AUC 5, pemetrexed and pembrolizumab, 4 cycles from 20 November 2025, then pemetrexed and pembrolizumab maintenance until 6 August 2026 (last dose). Best response partial response (CT February 2026). Pembrolizumab stopped for progression; no immune-related adverse events.

Medications: Metformin 1 g twice daily; empagliflozin 10 mg daily; tiotropium 18 mcg inhaled daily; oxycodone CR 10 mg twice daily and oxycodone 5 mg prn for L2 back pain; denosumab 120 mg subcut every 4 weeks (started September 2026).

Casey has had a difficult two months with back pain from the new L2 lesion and reduced appetite. He is up and about more than half the day and manages self-care, but no longer drives or does the garden. **ECOG 2.** MRI brain on 29 September 2026 showed no intracranial metastases. Radiotherapy to L2 (8 Gy single fraction) was given on 22 September 2026 with improvement in pain.

The CT of 1 October confirms progressive disease. Creatinine is 126 with eGFR 49, and albumin is 31.

Plan:
1. Second-line options discussed: sotorasib (KRAS G12C inhibitor, PBS) or docetaxel; also clinical trials of KRAS G12C inhibitors, noting his ECOG of 2 and prior melanoma.
2. Trial screening this week; if no suitable trial, start sotorasib 960 mg daily.
3. Review 15 October 2026.

Kind regards,

Dr Alex Rivera (synthetic)
